
60% occupancy; number weights Au13 / Au19 / Au43 = 0.5 / 0.3 / 0.2
Haar rotations; spherical pore radius 8 A, atom-centre clearance 0.5 A
Synthetic 100 nm porous crystal: independent Au size and position distributions
Centre ball 2 A: analytic confined distribution
Proposal ball 4 A: active wall conditioning
Empty host
Intensity (electron squared)
q (inverse angstrom)
Signed scattering contributions (active wall)
Within particles
Host-particle
Between particles
Contribution / non-forward total peak
q (inverse angstrom)
Numerical sampling uncertainty; significant points
Estimated integration uncertainty (%)
3 x SEM, refined sampling
3 x SEM, initial sampling
0.1% target
q (inverse angstrom)
